

Unable to connect to ASP.Net Development Server issue

[Ask Question](#)

I am debugging [codeplex simple project](#). I am using

30

- VSTS 2008
- C#
- Windows Vista x86 Enterprise.

★

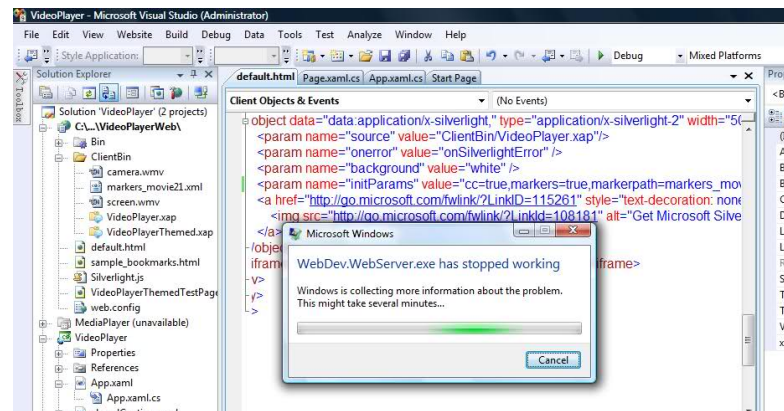

4

I have not modified any code of this codeplex project, and just press F5 to run VideoPlayerWeb project.

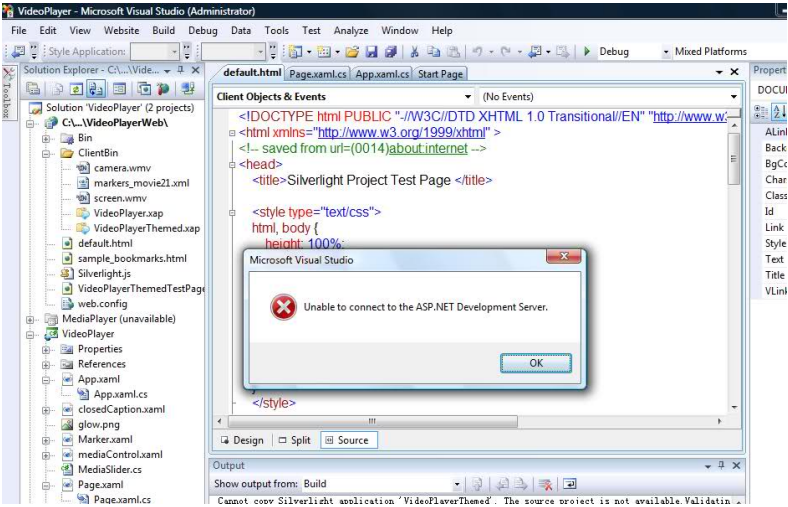

The current issue I met with is error message --

Unable to connect to ASP.Net Development Server.

Here is my screen snapshots when clicking F5. Any ideas what is wrong?

1 Have you hosted the project on IIS? Or are you running it directly from the file system? – Kirtan Jun 13 '09 at 5:35

I just pressed F5 and I think I should run it from file system? – George2 Jun 13 '09 at 6:02

I solved this here: stackoverflow.com/questions/2096628/... – claws Jan 20 '10 at 3:26

2 This is the correct answer ;) – [Brian](#) Oct 28 '10 at 17:26

+1 duhh I feel so stupid! Crystal Reports can easily crash VS web server and sometimes you really need to go kill it manually... – [dotjoe](#) Dec 19 '11 at 19:45

6

Could be a number of things...try these (check the last one first)...

- Disable IPv6
- Make sure there isnt an edit in the hosts file for localhost
- Check firewall/virus settings to allow connections to/from devenv.exe
- If you can preview in the browser make sure the URL in the browser uses the same port number as the port number shown in the ASP.NET dev server taskbar icon.
- Try setting a fixed, predefined port in project properties

I got these from a couple of forums elsewhere, hopefully they can help. Good luck. Let us know what works and some more about your environment (firewall, anti virus etc) can help as well.

Sure, and thanks! I am confused about two of your solutions -- "Disable IPv6" and "Make sure there isn't an edit in the hosts file for localhost"? Could you explain what do you mean please? – [George2](#) Jun 13 '09 at 6:05

Network Connections - Right Click - Click Properties (for your internet connection): Then if IPv6 is in the list try to disable that. Your host file may have an entry in it for localhost, comment it out and save the file (using notepad)
en.wikipedia.org/wiki/Hosts_file – [Marc](#) Jun 13 '09 at 6:10

I also faced this problem
stackoverflow.com/questions/2096628/.... After trying everything you said. I came to conclusion that WebDev.WebServer.exe may be corrupt. So, I've replaced C:\Program Files\Common Files\microsoft shared\DevServer\9.0\WebDev.WebServer.EXE with a fresh copy :
4shared.com/file/116555696/ff3b0dc8/WebDevWebServer.html
– [claws](#) Jan 20 '10 at 3:24

It cause the already that project port server is running in the current thread. You need to end process using task manager.

3

Follow below step:

1. Pres Ctrl+Alt+Delete (Task Manager)
2. find the asp.net server like WebDev.WebServer40.exe for VS2010 and press end process.
3. Now u continue with vs2010 run button

I went to the project file and changed the development server port to 1504. Well 1504 worked on another project for me, so I went with that. Hope this helps.

I have tried all of the above solutions and others from other websites too but with no luck.

3

What worked for me, was to rename or delete the applicationhost file:

C:\Users\User\Documents\IISExpress\config\applicationhost < rename or delete.

Makes sense. I was running a zipped up copy of a project which included the old developers .vs folder which includes an applicationhost.config with paths configured for his machine. – [b_levitt](#) Dec 18 '18 at 22:23

That is very odd! I hate to suggest something as simple as restarting Visual Studio...but that is what sounds like the best first place to start. Also, check your project settings

it...perhaps the solution/project is not set up to use the Casini server that is shipped with Visual Studio?

I have restarted VSTS but does not work. "perhaps the solution/project is not set up to use the Casini server that is shipped with Visual Studio" -- the error message I posted means VSTS thinks I should point to VSTS built-in web server or not? What project setting do you think I should check against? – [George2](#) Jun 13 '09 at 5:59

- 1 Another question is could I start the Casini server that is shipped with Visual Studio manually? If yes, how? – [George2](#) Jun 13 '09 at 6:06

2

Under project settings, try specifying a different port like 64773 for example. I have encountered this issue many times and it has always worked for me.

Here are the steps

1

1. 'Website' Menu in your visual studio ide.
2. select 'Start Options'
3. enable 'Use Custom Server' radio button.
4. Enter any URL you desire similar to '<http://localhost:8010/MvApp>'

By using our site, you acknowledge that you have read and understand our [Cookie Policy](#), [Privacy Policy](#), and our [Terms of Service](#).

Note1: you can use any port number not only '8010' but not designated port numbers like 8080(tcpip),25(smtp),21(ftp) etc.,

Note2: you can use any name not only 'MyApp'

This solution works for sure unless your WebDev.Webserver.exe is physically corrupted.

Error 1) Unable to connect Asp.net development server ?

Answer: No way find for that error

1

Try 1) Step 1: Select the "Tools->External Tools" menu option in VS or Visual Web Developer. This will allow you to configure and add new menu items to your Tools menu.

Step 2: Click the "Add" button to add a new external tool on Port 8010" (or anything else you want).

Step 3: For the "Command" textbox setting enter this value C:\WINDOWS\Microsoft.NET\Framework\v2.0.50727\WebDev.WebServer.exe. This points to the

web-server that VS usually automatically runs).

Step 4: For the "Arguments" textbox setting enter this value /path:\$(ProjectDir) (or any port you like)

Step 5: Select the "Use Output Window" checkbox (this will window from popping up

By using our site, you acknowledge that you have read and understand our Cookie Policy, Privacy Policy, and our Terms of Service.

and then choose this menu option to launch a web-server that has a root site on port 8010 (or whatever other port you want) for the project.

You can then connect to **this** site **in** a browser **by** simply s:
All root based references will work fine.

Step 6: The last step **is** to configure your web project to :
web-server when you run or debug a site instead of launch:

web-server itself. To-do this, select your web-project in the solution explorer, right click and select "property pages". Select the "start options" setting on the left, and

under server change the radio button value from the default (which is use built-in webserver) to instead be "Use custom server". Then set the Base URL value to be:

<http://localhost:8010/>

Obviously I don't know if this is the problem you had but (similar, essentially the problem should be that the sar

Development Server is not available because it is already used by another web server.

Try 2)

Here are the steps

1. 'Website' **Menu in** your visual studio ide.
2. **select** 'Start Options'
3. enable 'Use Custom Server' radio button.
4. **Enter** any URL you desire similar to 'http://localhos'

Note1: you can use any port number not only '8010' but not 8080(tcpip),25(smtp),21(ftp) etc.,

By using our site, you acknowledge that you have read and understand our Cookie Policy, Privacy Policy, and our Terms of Service.

This solution works for sure unless your WebDev.Webserver.

Both of not worked after that Windows repair option remain

My solution was to turn off Internet Connection Sharing on my wireless adapter, after which it immediately worked. I made no other change. I suspect ICS's DHCP server was interfering.

1 Thank you! Last thing I would have checked! – mdc Jan 7 '13 at 10:19

1

Try commenting out the following line, if it exists, in your hosts file (%windir%\System32\drivers\etc\hosts):

```
::1 localhost
```

This worked for me using Visual Studio 2008 SP1 on Vista

I got this problem a couple of times and done different things to fix it. When I got it this time all I did to stop getting "unable to connect to asp..." error, was rename the web app folder directory from xpCa1 to xpCa12. I also tried moving the web app directory to a different directory from C:\users\<me>\desktop\ to C:\users\<me>\desktop\new folder and it also worked.

I don't know why it worked, does VS 2010 keep information about web apps seperate from web apps folder.

In my case, when I had the ASP.NET Development Server crash, one thing that worked was to change the port for the project.

By using our site, you acknowledge that you have read and understand our [Cookie Policy](#), [Privacy Policy](#), and our [Terms of Service](#).

was not running in Task Manager, something was blocking a new instance of the web server from starting again on the original port. Changing the port was a decent enough work around. I could have rebooted, but who has time for that, right?

Details: Windows 7 x64, VS2010, .NET Framework 4.0, ASP.NET web site using the built in web server to VS2010.

BTW, I would be a little cautious with replacing the `WebDev.WebServerServer.EXE` as suggested in other posts. If that file has been corrupted then you have bigger problems with your OS.

1) not reflecting HttpContext in class file ?

Answer:-Most of the time when using this syntax in class file is not working we have to add reference then it work in class file

example using system.web write this syntax in class file

after that i add refrence system web than it reflect

None of the above solutions worked for me, but I did find one that worked: opening up the Administrative Tools/Services window and stopping the "WebClient" service. It's something of a pain to have to disable it when trying to work with my code, but it's easier than the logging off and back on I used to have to do.

Go to Run >> type >> cmd >> type taskkill /IM
webdev.webserver20.exe and then try to re run the
program

answered Feb 10 '13 at 3:19

By using our site, you acknowledge that you have read and understand our [Cookie Policy](#), [Privacy Policy](#), and our [Terms of Service](#).

In my case I was using Windows 8 and Windows Firewall was blocking WebDev.WebServer.EXE

0

So I went to the settings of Windows Firewall > Allow an app through Windows Firewall > Add new and browse to C:\Program Files (x86)\Common Files\Microsoft Shared\DevServer\11.0 Then select WebDev.WebServer to allow.

For some poor souls out there starting using TypeMock on ASP.NET unit tests like me, you need to disable it in Visual Studio to avoid this error: In Tools->Add-in Manager, untick the boxes for TypeMock Isolator. I guess you need to switch this back on for your unit tests.
