If statement in aspx page

Ask Question

▲

85

▼

I want to write a basic if statement on my site to display either item 1 or item 2 depending on if a variable is set to true.

I'm not too familiar with .NET and need a little help with the basic structure of how to get an if statement to work on the aspx page

if the purpose is to show or hide a part of the page then you can do the following things

1) wrap it in markup with

```
<% if(somecondition) { %>
    some html
<% } %>
```

2) Wrap the parts in a Panel control and in codebehind use the if statement to set the Visible property of the Panel.

Grz, Kris.

XIII i want to checked a radio button if some variable is true, how to do it .? – Ihsan chahi Sep 18 '13 at 13:29

sample code is <input type="radio" id="Accept" name="optpost" value="1" <% if(item.Accept == 1){ checked="checked" }%> class="Default" /> – Ihsan chahi Sep 18 '13 at 13:30

I tried, but it doesn't work. this is my code `<% if (false) { %> <asp:Label ID="lblQuantity" runat="server" Text='<%# Convert.ToDouble(Eval("Quantity")).ToString("#####0") + " " + Eval("unitMsr") %>'>></asp:Label> <% } %>` but it still show – John Nguyen Feb 10 '15 at 0:50 ✎

@JohnNguyen Can you create a new question for this and make up the code in a more readable fashion? – Kris van der Mast Feb 10 '15 at 11:24

@JohnNguyen It's because your markups is broken, in the end, here: %>'>></asp:Label> It's one > to much. Hope this hasen't been bothering your for 3 years xD – Eric Sjöström Jennerstrand May 30 '18 at 14:00

To use C# (C# Script was initialized at 2015) on ASPX page you can make use the following syntax.

2

Start Tag:- `<%` End tag:- `%>` Please make sure that all the C# code must reside inside this `<%%>` .

Syntax Example:-

- `<%@ Import Namespace="System.Web.UI.WebControls" %>` (For importing Namespace) Reference to some basic namespaces for working with ASPX page.

```
<%@ Import Namespace="System.Web.UI.WebControls" %>
<%@ Import Namespace="System.Diagnostics" %>
<%@ Import Namespace="System" %>
<%@ Import Namespace="System.Web" %>
<%@ Import Namespace="System.Web.UI" %>
<%@ Import Namespace="System.IO" %>
```

C# Code:-

```
`<%
if (Session["New"] != null)
{
    Page.Title = ActionController.GetName(Session["New"].ToString())
}
%>`
```

Features of C# Script:

- No need of compilation. Run time execution is occurred like Java Script.

Before using C# script make sure the following things:-

- You are on WebForm. Not on WebForm with master page.

- If you are in WebForm with master page make sure that you have written your C# script at Master page file.

- C# script can be inserted anywhere in the aspx page but after the page meta declaration like

```
<%@ Master Language="C#" AutoEventWireup="true"
CodeBehind="Profile.master.cs" Inherits="OOSDDemo.Profile" %>

<%@ Page Language="C#" AutoEventWireup="true"
CodeBehind="WebForm1.aspx.cs"
Inherits="WebApplication3.WebForm1" %>  (For WebForm)
```

A complete answer for optional content in the header of a
VB.NET aspx page using a master page:

2

```
<%@ Page Language="vb" AutoEventWireup="false" MasterPageFile="
CodeBehind="some_vb_page.aspx.vb" Inherits="some_vb_page" %>
<asp:Content ID="Content1" ContentPlaceHolderID="head" Runat="S
    <% If Request.QueryString("id_query_param") = 123 Then 'Add
        'which will not be visible in the rendered source code
%>
        <!-- add some html content depending on -->
        <!-- the condition in the if statement: -->
        <script src="http://ajax.googleapis.com/ajax/libs/jquer
type="text/javascript" charset="utf-8"></script>
    <% End If %>
</asp:Content>
```

Where your current page url is something like:

http://mywebpage.com/some_vb_page.aspx?
id_query_param=123

C#

-10

```
if (condition)
   statement;
else
   statement;
```

vb.net

```
If [Condition] Then
   Statement
Else
   Statement
End If
```

If else examples with source code... If..else in Asp.Net

I don't think he was struggling with the if syntax, more to do with how to
include this on an ASP page with HTML code in the statement blocks. –
Damon Smithies Aug 9 '16 at 15:20

remember this is aspx and needs the razor tags! – Steven Black Nov 22
'17 at 18:45

Just use simple code

37

```
<%
if(condition)
{%>

html code

<% }
else
{
%>
html code
<% } %>
```

2

```
<div>
    <%
        if (true)
        {
    %>
    <div>
        Show true content
    </div>
    <%
        }
        else
        {
    %>
    <div>
        Show false content
    </div>
    <%
        }
    %>
</div>
```
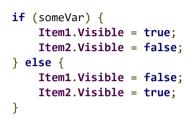

answered Jun 17 '10 at 16:11

Normally you'd just stick the code in `Page_Load` in your `.aspx` page's code-behind.

8

```
if (someVar) {
    Item1.Visible = true;
    Item2.Visible = false;
} else {
    Item1.Visible = false;
    Item2.Visible = true;
}
```

This assumes you've got `Item1` and `Item2` laid out on the page already.

I concur with Daniel DiPaolo on how best to handle a toggled ASP.NET page display item based upon a true / false variable. – JohnH May 28 '15 at 19:59

Here's a simple one written in VB for an ASPX page:

1

```
If myVar > 1 Then
    response.write("Greater than 1")
else
    response.write("Not!")
End If
```
